

ALARM, MONITORING AND CONTROL SYSTEMS

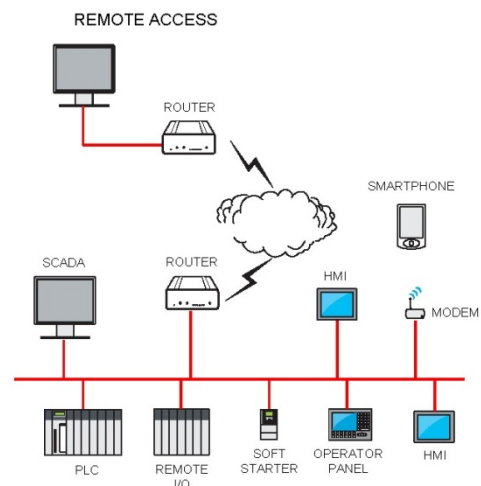

Integrated control and alarm systems have revolutionized life on board over the last decade. Historical alarm logs or tank and bilge level records, which were logged by hand, are now registered and stored automatically, in formats which can be later presented by means of tables with personalized filters, sorted according to their relevance or in easy to read graphics.

On the other hand, these systems have allowed the integration of all parameters in a single system, which includes surveillance of systems such as propulsion, fire alarm and the temperature of the SPA or saloon. The status of all of these systems may finally be monitored remotely via a Smartphone or a tablet from any location. All the information required to ensure the safe and efficient operation of the yacht can be found at your fingertips.

Astilleros de Mallorca has worked on the upgrade of alarm systems since they entered the market and are able to produce a custom design from the automation of a single system, such as lighting to total integration.

This wide offer is possible due to our capacity to program all kinds of PLCs, produce HMI screens with custom designs, ensure the compatibility of all kinds of signals whether digital or analogue or use any communication protocol.
